Detergent-resistant membranes in human erythrocytes and their connection to the membrane-skeleton

Annarita Ciana, Cesare Balduini and Giampaolo Minetti 2005, *J. Biosci.*, **30**, 317–328

As printed in the June 2005 issue, figure 3 of the article is wrong. The correct figure is shown below.

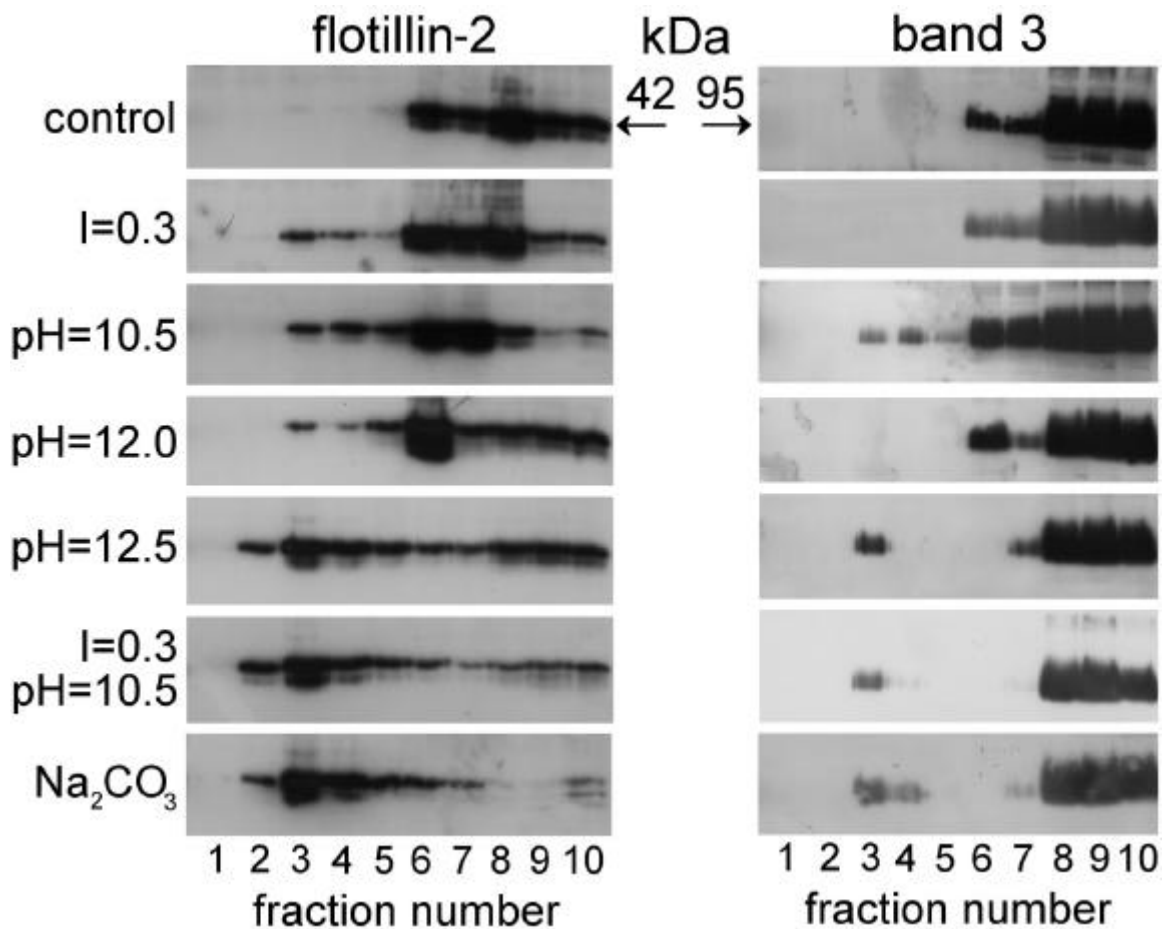

Figure 3. Immunodetection of flotillin-2 and band 3 in DRMs isolated from erythrocyte ghosts by various treatments. Flotillin-2 (left) and band 3 (right) Western blotting in ten fractions of 0.5 ml each, obtained from the sucrose gradients described in figure 2 and numbered from top to bottom. Flotillin-2 is enriched in DRMs (fractions 2–4) when the extraction conditions include, besides TX-100, higher pH (pH 12.5), or high pH and ionic strength ($I = 0.3/\text{pH} = 10.5$, or Na_2CO_3).
