

## Flowering Trees

*Zizyphus jujuba* Lam. (Hindi-Ber or pemdi-ber) of Rhamnaceae cultivated as well as wild is a moderate-sized tree. The plants bear curved spines, prominently-veined leaves that are rust-colored on the lower size and small, dull-white flowers in clusters. The globose or ovoid fruits are edible. The leaves are used for feeding tussar silk-worms. The wood is hard, closely-grained and used in making wheels.
