

## Flowering Trees

*Acacia leucophloea* (Roxb.) Willd. (White Babul) of Fabaceae is a medium size deciduous tree with spreading branches. The leaves are twice compound with a gland just below the first pair of leaflets and a pair of red colour spines on either side of the leaf base. Flowers are tiny, yellowish-white and aggregated into compact globose inflorescence. Inflorescences occur in bunches at the branch ends. The pod is long, slightly turgid and is depressed between seeds.

The timber is used to make agriculture implements and cart wheels.
