

General Editorial on Publication Ethics*

The scientific research and publishing communities the world over are well aware that instances of scientific misconduct seem to be on the rise. These are consequences of the increasing pressure to publish for career advancement, competition for research support, and desire for recognition, influence and fame. In recent years, many editorials have been written and international conferences have been held to discuss this issue which seriously affects both the conduct of science and the public perception of science.

The major forms of scientific misconduct are captured by three words: fabrication, falsification and plagiarism. Their meanings are self-evident. The first two forms are most likely to be detected by the rigorous peer review process instituted by all professional journals of quality. In those cases where a mendacious piece of work escapes detection and gets published, we can hope that later work by other scientists will expose the original misconduct.

We are concerned here particularly with plagiarism, which has become easier thanks to the growth of the Internet and easy access to vast amounts of written material. One dictionary defines plagiarism as “the appropriation or imitation of the language, ideas, and thoughts of another author, and representation of them as one’s original work”.

The degree of plagiarism could be as mild as the copying of a single sentence from another author without acknowledgement, or could involve much more extensive ‘lifting of material’ from other sources, including previous publications of the author themselves. John Ziman has emphasized that the three forms of misconduct mentioned above are equally serious and reprehensible: “plagiarism is as infamous as fabrication in a scientific paper”. As reprehensible as appropriating the thoughts, wording or visual representation from the work of someone else is ‘self-plagiarism’, which is the reproduction without acknowledgement of one’s own earlier published work, in whole or in part, under the guise of something original.

The Indian Academy of Sciences takes a very serious view of all forms of scientific misconduct, and especially of plagiarism (including self-plagiarism), as something directly affecting the integrity of the scientific process. Such behaviour is unacceptable and deserves exposure and an appropriate level of penalty. In case it is inadvertently published, a paper containing plagiarised material steals credit from the original source and erodes confidence in the quality and reliability of our journals.

To counter these problems, we have instituted several measures uniformly for all Academy

*The two statements being reproduced here are the same as appear in all the journals of the Academy.

GENERAL EDITORIAL

journals. Every case of suspected plagiarism brought to our attention will be investigated objectively and transparently by the journal editors as speedily as possible. If plagiarism is detected during the refereeing process, apart from immediate rejection the Academy will consider other steps commensurate with the seriousness of the case. In those situations where plagiarism is proven after publication, appropriate announcements will be placed in the journal. The Academy reserves the right to bring such instances to the attention of the author's employers and funding agencies, and also to inform the original author (where applicable) whose work has been plagiarized and the journal from where the plagiarised material has been taken.

We join our readers and contributors in continuing to hope that the vigilance and care exercised by our referees and editors will minimise this problem.

Academy Policy on Plagiarism

Plagiarism as a form of scientific misconduct has been on the rise in recent times. Defined by the US Office of Research Integrity as “the appropriation of another person’s ideas, processes, results or words without giving appropriate credit”, the increase in plagiarism is due not only to all too human failings, but also to the ease with which the emergence of the Internet has made such misconduct possible. Compared to earlier generations, training of students today seems to not convey a clear understanding of what is right and what is not in such matters.

The editors of all the journals of the Indian Academy of Sciences take a very serious view of any evidence of plagiarism including self-plagiarism in manuscripts submitted to them. Every reasonable effort will be made to investigate any allegations of plagiarism brought to their attention, as well as instances that come up during the peer review process. Such behaviour when proven beyond doubt is unacceptable, and will be suitably exposed. Self-plagiarism will be treated just as seriously.

Upon submission of a manuscript to any of the Academy journals, the author (or the Corresponding Author on behalf of all authors) will be required to sign a statement confirming that the work is original, that it has not been submitted elsewhere, the new results are the authors’ own findings, and all material taken from different sources has been appropriately acknowledged.

In those instances where in spite of these precautions a case of plagiarism goes undetected in the review process and is discovered after publication, both online and print versions of the journals concerned will carry a notice of the discovery. Depending on the seriousness of the case, the Academy reserves the right to inform the heads of the offending authors’ institutions and their funding agencies about the editors’ findings.

The jurisdiction for all disputes concerning submitted articles and published material will be at courts/tribunals situated in Bengaluru City only.
